

# Introduction of Archetypes

Mari-Elisa Kuusniemi, University of Helsinki

# FAIR archetypes

- Building archetypes is a method used in product, service, etc. design projects with a user experience (UX) approach.
- Archetypes are based on information collected, in this case via interviews.
- Archetypes help us to discover behavioural patterns to predict how a person will behave or react.
- The archetypes are not real persons.
- We decided to build two archetypes.
  - These archetypes represent extremes in the attitudes towards and awareness of the FAIR principles.

FAIR is requirement coming from outside the research community

No-one knows FAIR principles

No-one can understand or use my data

I need clear guidance, more support and money

I have no idea how opening data could benefit me

I have not used data created by others

FAIR is an integral part of good research practice

Everybody knows FAIR principles. I'm willing to work towards FAIR

I have utilized existing services for data management

Research articles without underlying data can not be trusted

I have used data created by others

I have own experience of benefits of opening data

FAIR Newbie

FAIR Master
