Abstract

Introduction

In low-resource settings, community health workers are frontline providers who shoulder the health service delivery burden. Increasingly, mobile technologies are developed, tested, and deployed with community health workers to facilitate tasks and improve outcomes. We reviewed the evidence for the use of mobile technology by community health workers to identify opportunities and challenges for strengthening health systems in resource-constrained settings.

Methods

We conducted a systematic review of peer-reviewed literature from health, medical, social science, and engineering databases, using PRISMA guidelines. We identified a total of 25 unique full-text research articles on community health workers and their use of mobile technology for the delivery of health services.

Results

Community health workers have used mobile tools to advance a broad range of health aims throughout the globe, particularly maternal and child health, HIV/AIDS, and sexual and reproductive health. Most commonly, community health workers use mobile technology to collect field-based health data, receive alerts and reminders, facilitate health education sessions, and conduct person-to-person communication. Programmatic efforts to strengthen health service delivery focus on improving adherence to standards and guidelines, community education and training, and programmatic leadership and management practices. Those studies that evaluated program outcomes provided some evidence that mobile tools help community health workers to improve the quality of care provided, efficiency of services, and capacity for program monitoring.

Discussion

Evidence suggests mobile technology presents promising opportunities to improve the range and quality of services provided by community health workers. Small-scale efforts, pilot projects, and preliminary descriptive studies are increasing, and there is a trend toward using feasible and acceptable interventions that lead to positive program outcomes through operational improvements and rigorous study designs. Programmatic and scientific gaps will need to be addressed by global leaders as they advance the use and assessment of mobile technology tools for community health workers.

FAIR Data Stewardship

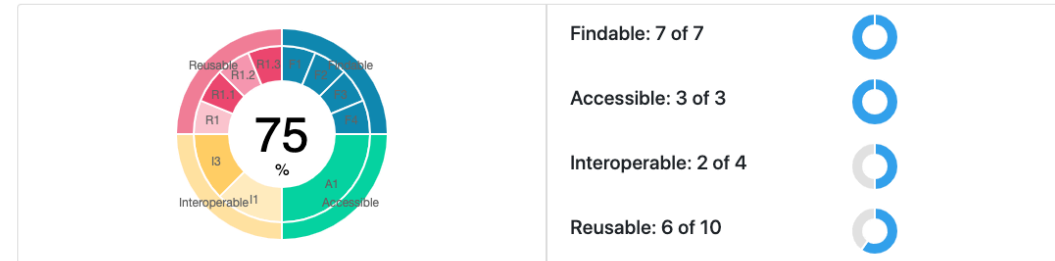

FAIR assessment

Our goal is to guide communities based on FAIR assessments of their data repository and hope this leads to action and as a result FAIRer data

Disclaimer: The test results shown here are based on preliminary data and code which still is under development. F-UJI is rapidly evolving and not yet available in a productive environment.

Summary:

Report:

Findable

FsF-F1-01D - Data is assigned a globally unique identifier.	✓
FsF-F1-02D - Data is assigned a persistent identifier.	✓
FsF-F2-01M - Metadata includes descriptive core elements (creator, title, data identifier, publisher, publication date, summary and keywords) to support data findability.	✓
FsF-F3-01M - Metadata includes the identifier of the data it describes.	✓
FsF-F4-01M - Metadata is offered in such a way that it can be retrieved programmatically.	✓

Accessible

FsF-A1-01M - Metadata contains access level and access conditions of the data.	✓
FsF-A1-03D - Data is accessible through a standardized communication protocol.	✓
FsF-A1-02M - Metadata is accessible through a standardized communication protocol.	✓

Interoperable

FsF-I1-01M - Metadata is represented using a formal knowledge representation language.	✓
FsF-I1-02M - Metadata uses semantic resources	✗
FsF-I3-01M - Metadata includes links between the data and its related entities.	✓

Reusable

FsF-R1-01MD - Metadata specifies the content of the data.	✗
FsF-R1.1-01M - Metadata includes license information under which data can be reused.	✓
FsF-R1.2-01M - Metadata includes provenance information about data creation or generation.	✓
FsF-R1.3-01M - Metadata follows a standard recommended by the target research community of the data.	✓
FsF-R1.3-02D - Data is available in a file format recommended by the target research community.	✓

FAIR uptake

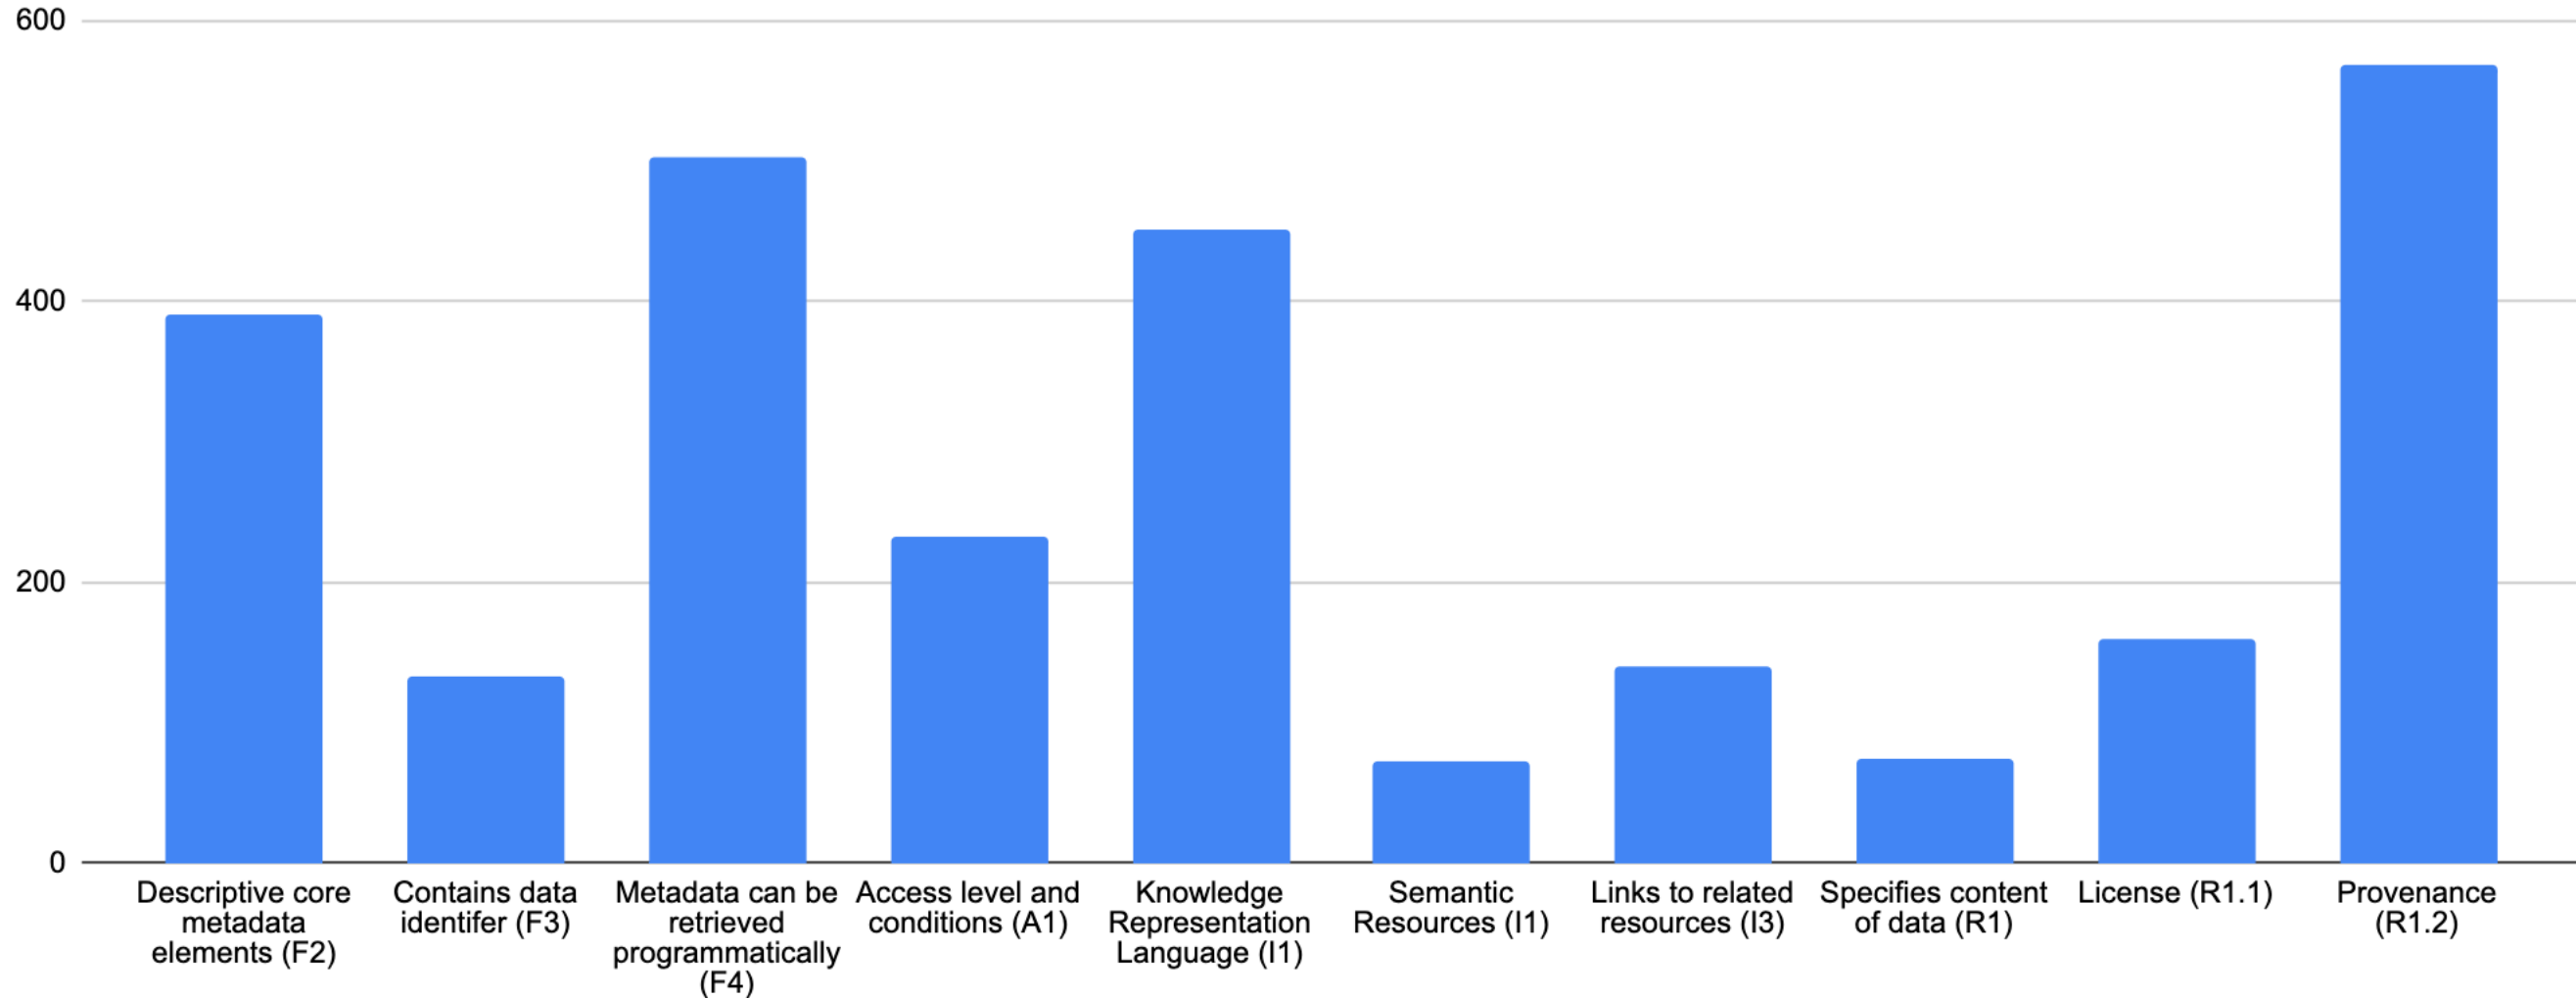

98 repositories (75 evaluated)

Evaluated using F-UJI

Assessment tests

Misc assessment output

Highlights

- The majority of repositories are not very FAIR, primarily because they do not support machine-actionable metadata
- 24% of the sample cannot be evaluated due to lack of GUID
- 23% of the sample does not support ma-FAIR (<0.1)
- The average score of the 75 evaluated repositories is 0.22
- Repositories running on established platforms score an average of 0.38
- Repositories that are certified score an average of 0.29

Take away

- Machine-actionable metadata (and data) is the way to FAIR!
- Local competent support staff to assist in the FAIRification of data is needed (data stewards)
- Persistent identifiers, (generic) metadata standards, licensing, provenance and data identifiers are among the important FAIR implementations

The End

Ongoing and coming tasks

Events to
support community
FAIRification process

Certification support for
repositories that
wish to go this route

Supporting
implementation of
FAIR data standards

FAIR incentives
and stakeholder
liaising

FAIR Certification

- Selection of 'suitable' repositories
- Adopting FAIR + CTS (recommendation from FAIRsFAIR)
- Interviews with prospective repositories
- WP4 certification team offers support for:
 - Self-assessment feedback
 - Guidance during the CTS cert. process
- Requires commitment (mainly an effort by repository)

FAIRification
